

Giving Your Outreach Addresses Their Own Home

We're moving your two outreach addresses off your main mailbox and into a separate, dedicated Google Workspace — so cold outreach can never touch your real business email. This guide walks you through the moves on your side, then shows how prospect replies reach you in ClickUp.

`ellie@shopjaydees.ca`

`ellie@shopjaydees.net`

What's changing, and why

Right now, `ellie@shopjaydees.ca` and `ellie@shopjaydees.net` are **aliases** riding on your main mailbox, `hello@shopjaydees.com`. That works, but it ties your cold outreach to your main business inbox: they share one reputation, and replies and bounces land mixed in with your real email.

We're going to give those two addresses **their own separate home** — a brand-new Google Workspace, completely apart from your main one. After this:

- Cold outreach sends from addresses that stand on their own — it **can never affect the reputation of** `shopjaydees.com` or your main inbox.
- Each address warms up **properly and independently**, which means better delivery.
- Your main inbox stays clean — no cold-outreach bounces or replies mixed in.

Your main email is never touched. Everything in this guide happens on `shopjaydees.ca` and `shopjaydees.net` only. `hello@shopjaydees.com` and everything on `shopjaydees.com` keeps working exactly as it does today — we never remove, move, or change it.

On cost: the new Workspace runs about **\$17 CAD/month** for the two mailboxes. The **\$150 credit** on your final invoice more than covers the first three months — so this change costs you nothing extra to get started.

There are **six short steps**. You handle the first five — they're done in your Google admin console and your DNS settings; Cody finishes the final hookup. Set aside about **30–40 minutes**.

1 Free up the two domains

YOU DO THIS

A domain can only live in one Google Workspace at a time, so first we release **shopjaydees.ca** and **shopjaydees.net** from your current Workspace. (Again — this does *not* touch **shopjaydees.com**.)

1. Sign in to the Google **Admin console** at **admin.google.com** with your administrator account.
2. **Remove the two aliases first.** Go to **Directory** → **Users**, open the **hello@shopjaydees.com** user, and find the **Alternate email addresses (aliases)** section. Delete **ellie@shopjaydees.ca** and **ellie@shopjaydees.net**. Save.
3. **Remove the two domains.** Go to **Account** → **Domains** → **Manage domains**. Find **shopjaydees.ca**, choose **Remove domain**, and confirm. Do the same for **shopjaydees.net**.

If Google won't let you remove a domain — it usually means an address is still using it. Double-check both aliases were deleted in the step above, then try again. If it still blocks you, send Cody a screenshot and stop here; he'll sort it before you continue.

2 Create the new Google Workspace

YOU DO THIS

Now we set up the separate home for the outreach addresses.

1. Go to **workspace.google.com** and click **Get started** (or **Start free trial**).
2. When asked for a business name, use something like **ShopJaydees Outreach** — this keeps it clearly separate from your main account.
3. When it asks "**Does your business have a domain?**", choose **Yes, I have one I can use**, and enter **shopjaydees.ca**. (*It's now free to use, because you released it in Step 1.*)
4. Pick the **Business Starter** plan — it's the lowest tier and all we need.
5. Create the admin sign-in for this new Workspace. **Use a different password from your main account**, and keep these new login details somewhere safe — this is a brand-new, separate account.

Heads up: this is a *second* Google Workspace, separate from your main one. You'll have two admin logins now — your existing **hello@** one, and this new outreach one. That separation is exactly the point.

3 Add & verify both domains

YOU DO THIS

Inside the new Workspace's setup wizard:

1. Follow the prompt to **verify** that you own **shopjaydees.ca**. Google gives you a **TXT record** to add at your domain registrar (where you manage your DNS). Add it, then click **Verify**.
2. Add **shopjaydees.net** as a **second domain**: in the new Admin console, go to **Account** → **Domains** → **Manage domains** → **Add a domain**, enter **shopjaydees.net**, and verify it the same way (another TXT record).
3. The wizard will also show **MX records** (these route incoming mail). Add or confirm them as Google instructs for each domain.

Not sure about DNS records? This is the one fiddly part. If anything is unclear, send Cody a screenshot of where you manage your domain's DNS and he'll give you the exact records to paste — or hop on a quick call. Don't guess.

4 Create the two mailboxes

YOU DO THIS

These are real mailboxes now — each with its own inbox and password, not aliases.

1. In the new Admin console, go to **Directory** → **Users** → **Add new user**.
2. Create **ellie@shopjaydees.ca** (First name **Ellie**). Set a password and note it down.
3. Add a second user, **ellie@shopjaydees.net**, the same way.
4. Send Cody the two new addresses and their passwords (or share them however you prefer) so he can connect them.

Almost there — the mailboxes exist; one set of DNS records to add next, then you're done.

5 Set up email authentication

YOU DO THIS

This is the set of DNS records that proves your outreach mail is genuine and keeps it out of spam folders — **SPF, DKIM, and DMARC**. Since you manage the DNS, you add all three, on **each** of the two domains. Everything you need is below; Cody is happy to confirm any value if something looks unclear.

SPF — add this as a **TXT** record on the domain root (**@**):

- `v=spf1 include:_spf.google.com ~all`

If an SPF record already exists on the domain, don't add a second one — a domain may only have one. Edit the existing record so it includes `include:_spf.google.com`.

DKIM — Google generates this one for you:

1. In the new Admin console, go to **Apps** → **Google Workspace** → **Gmail** → **Authenticate email**.
2. Pick the domain, click **Generate new record** (use the **2048-bit** key), and copy the **TXT** record it shows you.
3. Add that **TXT** record at your DNS host (the host/name is usually `google._domainkey`), then return to the console and click **Start authentication**.
4. Switch the domain selector to `shopjaydees.net` and repeat — DKIM is per-domain.

DMARC — add this as a **TXT** record at the host `_dmarc` on each domain:

- `v=DMARC1; p=none;`

We start at `p=none` on purpose — it monitors without affecting delivery while the addresses warm up.

That's your part done. Once SPF, DKIM, and DMARC are live on both domains, let Cody know (along with the mailbox logins from Step 4) — the rest is his.

6 Cody finishes the hookup

CODY DOES THIS

From here Cody takes over the final pieces:

- **Reconnects both addresses to Instantly** — and because they're now real mailboxes, this uses the simple, stable Google sign-in (no more App Password workaround).
- Runs **warmup** on both addresses for **2–3 weeks** before any real campaign sends, building their sending reputation from scratch.
- Confirms your **SPF, DKIM, and DMARC** are validating correctly before campaigns start.

He may ask you to approve the Instantly connection once inside the new Admin console — if so, he'll tell you exactly where to click.

How replies reach you — all in ClickUp

Once campaigns are live, you **never have to watch a separate inbox**. When a prospect replies, everything you need surfaces on that lead's card in ClickUp — right where you already do your daily review.

1 A prospect **replies** to one of your outreach emails. Instantly catches it instantly.

2 The system **updates that lead's card in ClickUp automatically**: the status flips to **"Responded — Owner Follow-up,"** the prospect's reply is posted right on the card, and the card is **assigned to you with a notification**.

3 In your **daily review**, you open the card. You read the reply *alongside* everything about that lead — the fit score, what was sent, and their company details.

4 You **reply from Instantly's Unibox** (it keeps the conversation on the same thread), and in that reply you **hand over your direct address**, **hello@shopjaydees.com** — moving the warm conversation onto your main business inbox, where it belongs.

So the split stays clean: **cold sending lives on the separate .ca / .net addresses, and real conversations move to your main email** the moment someone's interested.

Why not just CC your main inbox on everything? On purpose. Keeping cold outreach off **hello@** is what protects your main email's reputation. ClickUp gives you one place to see and act on every reply — *with* the fit score and full history a CC could never show you.

Before & after, at a glance

	Before (today)	After (this change)
Where ellie@ lives	Alias on your hello@ mailbox	Its own mailbox in a separate Workspace
Effect on shopjaydees.com	Shares reputation & risk	Fully isolated — no effect
Warmup	Shared, not truly independent	Independent per address
Replies & bounces	Mixed into hello@	Stay on the outreach mailboxes
Where you act on replies	—	The lead's card in ClickUp

Questions at any point? Email cody@sixohquad.com — and if a DNS or domain step looks unclear, send a screenshot rather than guessing.
